ACKNOWLEDGMENTS

The authors would like to acknowledge the contributions of several individuals to the preparation of this report. We wish to express our sincere thanks to Allison Hedley Dodd, who reviewed a draft of the report; Betty Teller, who edited the report; and Sharon Clark, who prepared the final manuscript. We also want to thank Cara Petroski in the Office of Enterprise Management, Centers for Medicare & Medicaid Services, for her guidance during this project.

I. INTRODUCTION

As a result of the Affordable Care Act (ACA), the Centers for Medicare & Medicaid Services (CMS) and its Center for Medicare and Medicaid Innovation (CMMI) are stimulating a number of revolutionary changes in the health care delivery system in the quest for better health care at a more affordable price. Numerous innovation strategies and comparative effectiveness research (CER) are underway to improve care. To gauge whether these innovations are working successfully, researchers need complete and accurate data about the people receiving the care, the types of services received, and the costs of the services.

Since 1999, all states and the District of Columbia have submitted Medicaid enrollment, expenditures, and service utilization records in a standard format to the Medicaid Statistical Information System (MSIS). Mathematica, on behalf of CMS, has produced research files derived from these data for each state by calendar year. MAX files are a more research-friendly set of Medicaid administrative files. The enrollment information in MAX identifies monthly enrollment after the retroactive/correction records have been applied and after certain state-specific data elements are transformed into a consistent, national format. The claims in MAX identify the services rendered and the cost of those services after the adjustments—such as voids, credits, and debits—have been applied. In addition, the enrollment data pertain to people enrolled in the given calendar year (CY), and the claims and encounter records pertain to the services rendered in that same time period, thereby making a consistent—and more meaningful—time period for analyses of enrollment, service utilization, and expenditures.

Researchers sometimes use death as an outcome measure, typically measuring duration until death or including an indicator of death in a specific time period. To support these analyses, the MAX Person Summary (PS) file contains three dates of death: (1) the MSIS date of death, which is reported by the state in the MSIS file; (2) the Medicare Enrollment Database (EDB) date of

death, which is linked to the MAX PS file during MAX production (and is available only for people who are dually enrolled in Medicare and Medicaid); and (3) the date of death extracted from the Social Security Administration's (SSA) Death Master File (DMF), which is linked to the MAX PS file during MAX production. All three dates of death (DOD) are right-censored, meaning they contain dates of death that occurred prior to or during the MAX CY. For example, no one in the MAX 2007 PS file has a date of death after 2007.

CMS requested the development of the MAX DOD master file, which is a file of all persons enrolled in Medicaid since 1999 who subsequently died, so that researchers could have the most up-to-date information on the date of death, including deaths that occurred after the MAX CY. Last year, we created a MAX DOD 1999–2008 master file that contained all Medicaid enrollees in 1999–2008 who had died before October 29, 2011. In conjunction with the newly released MAX 2009 data, CMS requested that the MAX DOD master file be updated to include both new Medicaid enrollees in 2009 who died and the most up-to-date DOD information for people enrolled in 1999–2008 who died. To accomplish this, we created two files: (1) a MAX DOD 1999–2009 master file and (2) a MAX DOD 2009 “update file.” The MAX data warehouse contractor will apply the update file to the existing MAX DOD 1999–2008 master file. When the contractor is finished, their new master file will be identical to our MAX DOD 1999–2009 master file. The MAX data warehouse contractor will disseminate the MAX DOD master file to approved research activities.

In this report, we describe the creation of the MAX DOD update file for 2009 and the MAX DOD 1999–2009 master file. In Chapter II, we provide a brief synopsis of the data sources used in this process. In Chapter III, we describe the creation of the MAX DOD update file and present quality control statistics about the number of records in the update file and in the new MAX DOD 1999–2009 master file. In Appendix A, we provide a data flow diagram describing

how the MAX DOD 2009 update file and the new MAX DOD 1999–2009 master file were created. Appendix B contains the file layout and data dictionary for the update file, and Appendix C contains the file layout and data dictionary for the MAX DOD master file. Appendix D includes some frequently asked question about the DOD information.

This page has been left blank for double-sided copying.

II. DATA SOURCES

In this chapter, we describe the data sources used in the creation of the MAX DOD 2009 update file: (1) the date of death source file, (2) the Medicaid enrollment files, and (3) the most recent MAX DOD information, the MAX DOD 1999–2008 master file.

A. Source Data for Dates of Death

There are several sources of information that could have been used for the dates of death, including the National Death Index (NDI), the SSA DMF, the Beneficiary Identification Records Locator Subsystem (BIRLS) Death File, Veterans Affairs (VA) beneficiary death records, and Internal Revenue Service (IRS) records (Baugh et al. 2012). Each of these data sources has strengths and weaknesses. The two most prominent DOD files are the NDI and the DMF, which are described in more detail here.

1. NDI

The NDI is a centralized repository of death records at the National Center for Health Statistics (NCHS). The records are purchased by NCHS from each state's vital statistics office (NCHS 2013). The data include not only the date of death but the cause of death, information that could be potentially useful to researchers. However, there are two big drawbacks that make these data less desirable: cost and timeliness. NCHS charges \$350 plus \$0.15 per record per year, which means that for just one year of MAX (approximately 60 million enrollees), the price equates to more than \$9 million. In addition, to allow enough time for data collection and processing, there is a two-year lag between the date of death and the reporting of the death in the NDI.

2. SSA DMF

The DMF is an SSA file compiled from SSA payment records and other sources of death information, including decedent's family members, funeral homes, hospitals, and financial institutions (SSA 2013). There is a public version and a federal agency version of the file. The

public version excludes death records collected through SSA's contracts with the states but the federal version does not. CMS, in partnership with SSA, obtains the federal version of the SSA DMF on a weekly basis and makes the information available on a need-to-know, mission-critical basis. The drawbacks of the DMF are: (1) it does not include the cause of death, and (2) over time, the content of the DMF can change (for example, dates of death can be removed or updated) as new information is obtained. Because of the DMF's timeliness and affordability, CMS selected the DMF as its source file for the MAX DOD file. During this update process, we used the latest version of the SSA DMF, version April 20, 2013.

B. Source Data for Medicaid Enrollment

The MAX PS file is the source file for Medicaid enrollment. There is one PS file for each state for each year, and each file contains one record for each person enrolled in Medicaid or the Children's Health Insurance Program (CHIP). Each file uniquely identifies a person by the MSIS identification number (MSIS ID). States can use their own state-assigned identifier or the person's Social Security number (SSN) as the MSIS ID. CMS instructions to the states request that an enrollee be assigned one and only one MSIS ID over time, but states do sometimes assign more than one MSIS ID or change the MSIS ID over time. As a condition of eligibility, federal regulations require that all Medicaid applicants furnish their SSNs, with the exception of nonqualified aliens and individuals with well-founded religious objections. For the most part, the SSN and date of birth (DOB) are stable, but there are instances in which that information changes over time.¹ It is generally accepted that the most recent information about the enrollee is the most accurate information (the "last is best" rule).

¹ A state's Medicaid agency may eventually learn that the SSN or DOB for a Medicaid enrollee was incorrect. When this happens, the state changes the SSN and/or DOB on the person's enrollment record. Consequently, there are instances in the MAX PS files in which a Medicaid enrollee (as identified by STATE and MSIS_ID) has more than one SSN and/or DOB over time. Therefore, we *could* encounter a situation in which more than one date of

C. MAX DOD Master File, 1999–2008

After MAX 2008 files were completed for all states, we created the MAX DOD master file for 1999–2008 using the following steps:

- Extract enrollee records from the MAX PS file for each state for each year, excluding records with a missing SSN or missing DOB²; this forms the set of all possible Medicaid enrollees who could link to the DMF
- For each year for each state, merge the DMF to the MAX PS record using the person’s SSN and DOB (both must match exactly, gender is not available on the DMF)
- For each state, concatenate all of the enrollees’ records by MSIS ID and year of enrollment and take the last record per person (“last is best”)
- Retain only the enrollees who died
- Concatenate all state DOD files to form the national MAX DOD master file

The file contains one record for each enrollee in 1999–2008 who died (10,182,290 records).

(continued)

death was assigned to the same person at different times. Our algorithm assumes that the latest (most recent) SSN and DOB are the most accurate and uses the corresponding date of death associated with that SSN and DOB.

² SSN is classified as missing if it contains all 0’s, 8’s, 9’s, or spaces. DOB is classified as missing if it contains all 0’s, 8’s, or 9’s, or equals 101.

This page has been left blank for double-sided copying.

III. CREATION OF THE MAX DOD 2009 UPDATE FILE AND THE MAX DOD 1999–2009 DOD MASTER FILE

In this chapter, we describe the file-creation process of the MAX DOD 2009 update file and provide helpful quality control statistics to persons using either the MAX DOD 2009 update file or the MAX DOD 1999–2009 master file.

A. File-Creation Process for the MAX DOD Update File

We created the MAX DOD 2009 update file using the following steps. The first four steps create the new master file and the final two steps are specific to the update file:

1. Extract enrollee records from the MAX PS file for each state and year, for 1999–2009, excluding records with a missing SSN or DOB.^{3,4}
2. For each state for each year, merge the latest DMF (version April 20, 2013) to the MAX PS record using the SSN and DOB. When both variables match exactly, retain the DMF DOD; otherwise set the DOD to missing (all 8’s).
3. For each state, concatenate all PS records for 1999–2009, sort by MSIS ID and year, set a dummy flag (0, 1) for each year in which the person was enrolled, and keep the last nonmissing DOD record in the stack for each unique MSIS ID (last is best).
4. Concatenate all state DOD files to form the new, national MAX DOD master file.
5. Merge the new MAX DOD master file (1999–2009) to the old master file (1999–2008) by state and MSIS ID and classify the records into four distinct groups. If the record is in the new but not the old master file, classify the record as an “Insert” record (record type = I). If the record is in both files but the dates of death differ, classify the record as an “Update” record (record type = U). If the record is in the old but not the new file, classify the record as a “Delete” record (record type = D). All other records in the new master file are classified as “No action” (record type = “”).
6. Restrict the update file to records with record type = I, U, or D.

Appendix A contains a data flow diagram describing how the file was created.

³ SSN is classified as missing if it contains all 0’s, 8’s, 9’s, or spaces. DOB is classified as missing if it contains all 0’s, 8’s, or 9’s, or equals 101.

⁴ If we had preserved the PS extracts during the MAX DOD 1999–2008 file-creation process, we would have only needed to extract MAX PS records from one year: 2009. Going forward, we will preserve these extract files to save resources.

B. MAX DOD 2009 Update File

In Table III.1, we display the number of records in the original MAX DOD master file (1999–2008) by state (10.2 million decedents). The “number of insert records (1999–2008)” column shows that 1.2 million people who were enrolled in 1999–2008 died since the MAX DOD 1999–2008 master file was created (approximately one year ago). The “number of insert records (2009 enrollees)” column shows that 321,725 enrollees were new to the Medicaid program in 2009 and died by the time of the updated DMF. The “number of update records” column shows that the date of death changed for 1,929 enrollees. The “number of deletion records” column shows that 3,818 enrollees had a date of death in the original MAX DOD 1999–2008 master file but either SSA removed that person’s record from the DMF or the person’s SSN or DOB changed in MAX in such a way as to disconnect the record from the DMF. Because we assume the last status is the most accurate, we allow these records to be removed from the MAX DOD master file.

The MAX DOD update file, which is sorted by state and MSIS ID, is called MW00.@BF32955.US.PS.DOD.UPDATE.V130429. The file contains the following four variables: state, MSIS ID, SSA DOD, and record type. Appendix B contains the data dictionary, which describes the file layout and valid values for each variable in this file.

To apply the MAX DOD update records to the MAX DOD 1999–2008 master file, link the files by state and MSIS ID. Use the record type to control how the record is used. When the record type = I, add the record to the master file. When the record type = U, replace the DOD in the master file with the DOD in the update file. When the record type is D, remove the record from the master file.

Source: MAX DOD 1999–2008 Master File, insert/update/delete records generated by linking the MAX 1999–2009 Person Summary File to the SSA Death Master File (version 04/20/2013) and then linking those records to the MAX DOD 1999–2008 Master File, and the MAX DOD 1999–2009 Master File

C. MAX DOD 1999–2009 Master File

In the last column of Table III.1, we display the number of records in the MAX DOD 1999–2009 master file by state, after all update records have been applied. The new total record count is 11,714,856 records.

The new MAX DOD master file is called MW00.@BF32955.US.Y2009.PS.DOD.⁵ The file is sorted by state and MSIS ID and contains three variables: state, MSIS ID, and SSA DOD. Appendix C contains the data dictionary, which describes the file layout and valid values for each variable in this file.

D. Decedents by State and Year

As shown in Table III.2, the number of records in the MAX DOD file varies considerably by state. However, the number of decedents is not solely a function of the number of Medicaid enrollees, as evidenced by the variation in the percentage of enrollees with a DOD (Table III.3). The proportion of decedents is highest in 1999 and gradually reduces with each subsequent year. This downward trend is expected; enrollees get older as time passes, and there is more time for a death to occur. In other words, Medicaid enrollees in 1999 have a greater likelihood of dying by April 2013 than Medicaid enrollees in 2009, all other things being equal.

E. Limitations

The number of MAX PS records that linked to the DMF is a function of the accuracy of both the DMF and the SSN and DOB in the MAX PS file. The SSN in the PS file is supposed to be verified by the state's Medicaid agency, but there is no way to identify whether this verification occurred. There could be incorrect SSNs and DOBs, which could generate false positives if incorrect records were linked, or false negatives if records could not be linked. However, an

⁵ The MAX DOD 1999–2008 master file is called MW00@BF32955.US.Y2008.PS.DOD.

analysis of the reporting and validity of the SSNs in 2009 Medicaid administrative data was encouraging (Czajka and Verghese 2013): among records with SSNs reported in the valid range, only 0.6 percent were classified as having incorrect SSNs by the Census Bureau.

APPENDIX A

DATA PROCESSING STEPS FOR THE MAX DOD 2009 UPDATE FILE

This page has been left blank for double-sided copying.

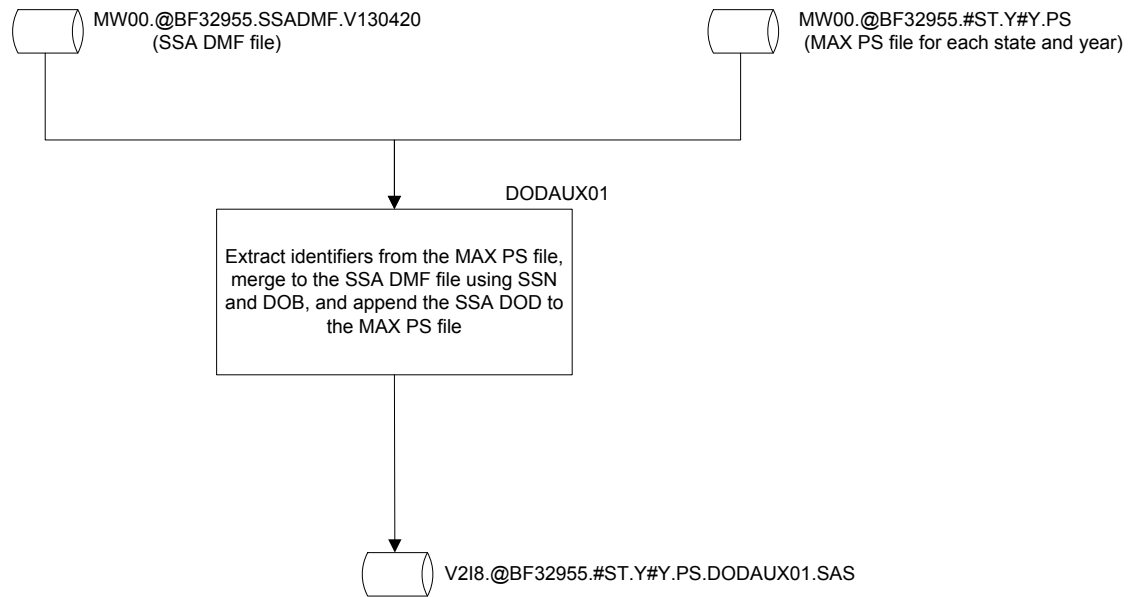

We used three programs to create the MAX DOD update file. The programs were written in SAS and were designed to maximize efficiency and reusability.

1. DODAUX01 extracts identifiers and demographic data from the MAX PS file and merges them to the SSA DMF file using SSN and DOB. The SSA DOD is appended to the output file. We execute the program separately for each state and the District of Columbia (hereafter referred to as “51 states”).
2. DODAUX02 concatenates the files for all years for each state and keeps the latest record with nonmissing SSN and DOB per MSIS ID to ensure one date of death per person.⁶ We keep only the records that linked to the DMF and have a nonmissing date of death.
3. DODAUX03 concatenates the MAX DOD files for all 51 states and retains the state code, the MSIS ID, and the SSA date of death. This forms the new MAX DOD 1999–2009 master file. We save the master file as a SAS file and as a text file. We merge the new MAX DOD master file (1999–2009) to the old master file (1999–2008) by state and MSIS ID and classify the records into four distinct groups. If the record is in the new but not the old master file, we classify the record as an “Insert” record (record type = I). If the record is in both files but the dates of death are different, it is classified as an “Update” record (record type = U). If the record is in the old but not the new file, it is classified as a “Delete” record (record type = D). All other records in the new master file are classified as “No action” (record type = “”).

We display the corresponding data flow diagrams in Figures A.1–A.3.

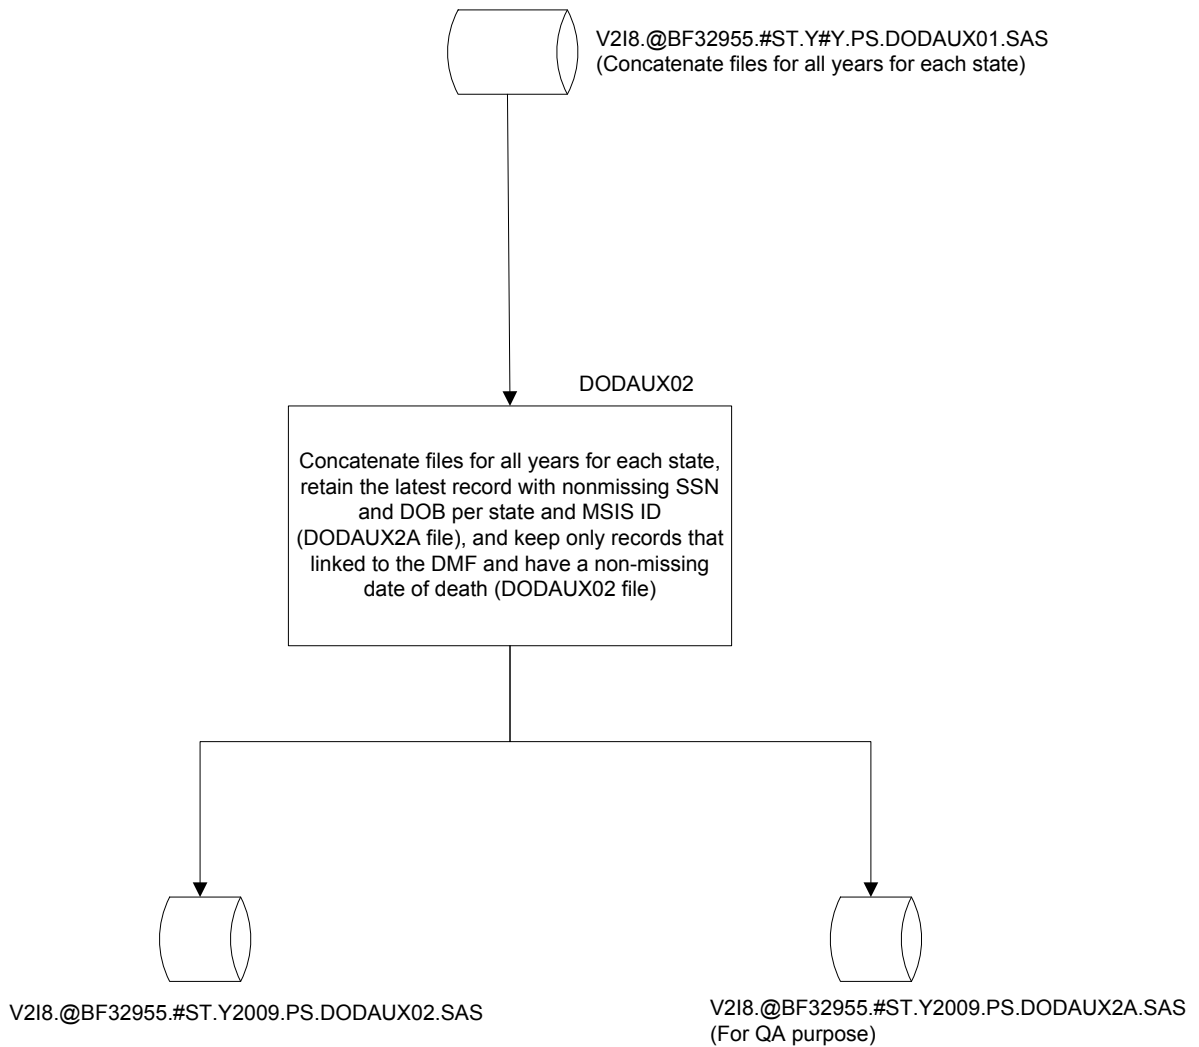

⁶ A state’s Medicaid agency may eventually learn that the SSN or DOB for a Medicaid enrollee was incorrect. When this happens, the state changes the SSN and/or DOB on the person’s enrollment record. Consequently, there are instances in the MAX PS files in which a Medicaid enrollee (as identified by STATE and MSIS_ID) has more than one SSN and/or DOB over time. Therefore, we could encounter a situation in which more than one date of death was assigned to the same person at different times. Our algorithm assumes that the latest (most recent) SSN and DOB are the most accurate and uses the corresponding date of death associated with that SSN and date of birth.

FIGURE A.1. DODAUX01

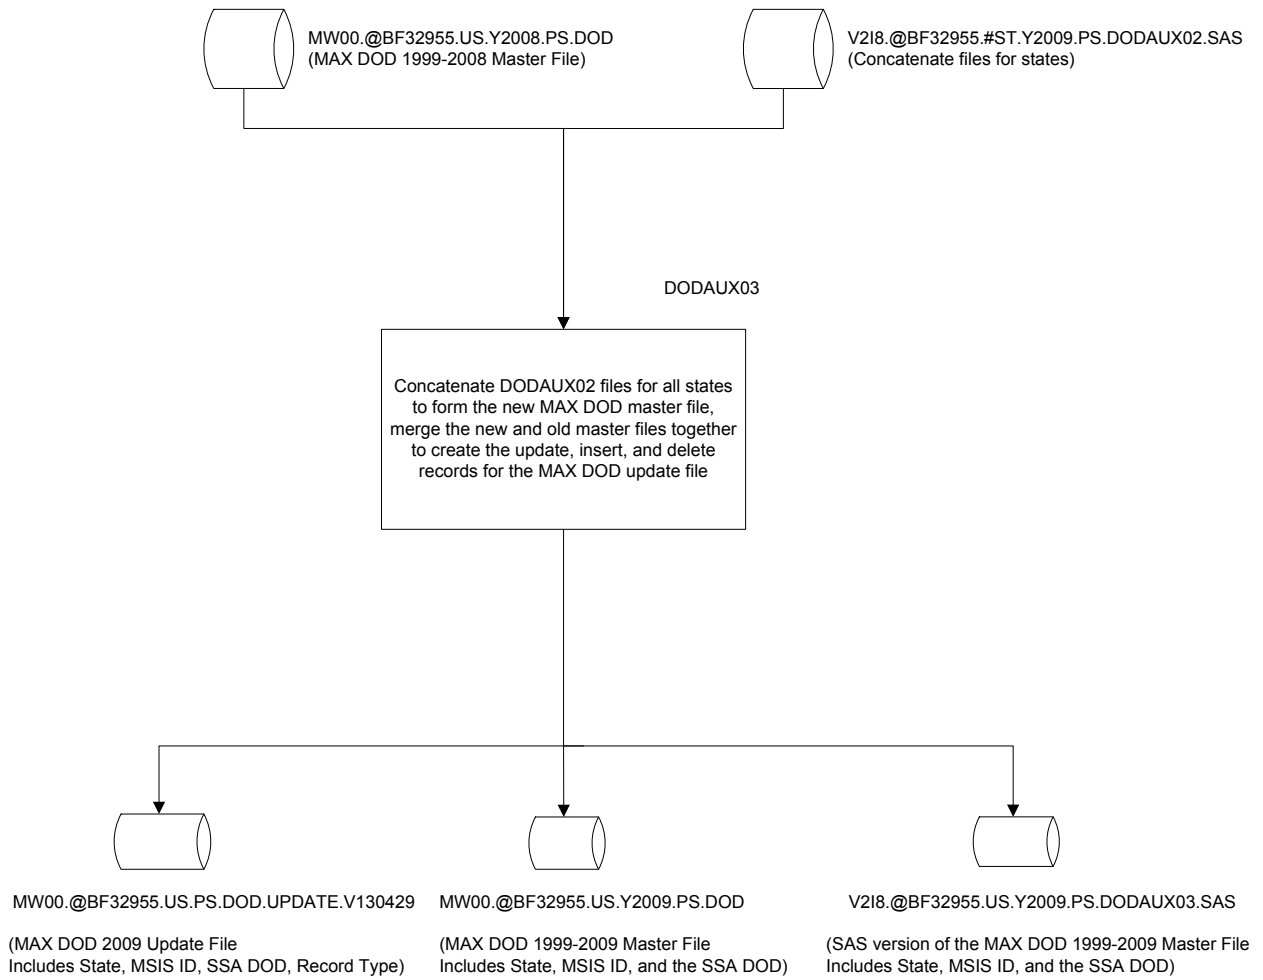

DODAUX01 command list (CLIST) submits this program for each year (#Y) for each state (#ST)

FIGURE A.2. DODAUX02

DODAUX02 command list (CLIST) submits this program for each state (#ST)

APPENDIX D

FREQUENTLY ASKED QUESTIONS ABOUT DATES OF DEATH

This page has been left blank for double-sided copying.

New Medicaid researchers are often puzzled by the importance of the three dates of death in the MAX PS file and the MAX DOD file. In this section we describe two frequently asked questions (FAQs) about the DOD information and reiterate how best to use this information.

1. FAQ #1: The MAX PS files contain three DOD data elements. How accurate are they, and which one should researchers use?

The MAX PS files contain three DOD data elements:

- Medicaid date of death as reported by the Medicaid state agency
- Medicare date of death date as obtained from the link between MAX PS records and the Medicare EDB
- Date of death from the SSA DMF as obtained from the link between MAX PS records and the DMF

It is well known that DODs are underreported by Medicaid state agencies in MSIS, the source for MAX. We linked MAX data to the Medicare EDB and captured the Medicare DOD, as we believe the reporting of DODs in the Medicare data system for dual enrollees is more complete than in MSIS. However, the MAX PS-to-EDB link only improved DOD reporting in MAX reporting for people dually enrolled in Medicare and Medicaid. There was still concern about DOD underreporting for nondual Medicaid enrollees. This concern led to linking records in the MAX PS and the SSA DMF.

We recommend the following hierarchy of use among the three DOD data elements in the MAX PS file:

- If present, use the DOD from the SSA DMF.
- If the DMF DOD is missing, use the Medicare DOD.
- If both the DMF and Medicare DODs are missing, use the Medicaid DOD.

2. FAQ #2: What is the MAX DOD file, and when should I use it?

Researchers often use death as an outcome measure, typically measuring duration until death or including an indicator of death within a certain time period. The regular MAX PS files have been linked to the SSA DMF and include deaths that occur *during* (or prior to) the MAX CY.

However, to support CER and other outcomes research, it is beneficial to have the most up-to-date DOD information, including deaths that occurred *after* the MAX file year. The MAX DOD file was created to meet this need.
